

ACCkart Investment Intelligence

■10 Lakh Decision — Analytical Report

Objective: allocate the supplied ■10,00,000 budget using evidence from orders, products, customer behaviour, marketing, returns and delivery data.

1. Executive Summary

ACCkart records 30,000 orders and ■232,649,270 net revenue. Total recorded order profit is ■11,365,480, producing a 4.9% margin. Electronics contributes 79.3% of revenue but its observed margin is only 2.5%. Grocery is loss-making at ■-366,690. West has a 93.7% delivery-delay rate. These signals support a balanced investment approach: scale historically productive acquisition/retention channels while funding targeted delivery, retention and margin repair.

2. Core KPIs

Metric	Value
Orders	30,000
Net Revenue	■232,649,270
Profit	■11,365,480
Profit Margin	4.9%
AOV	■7,755
Return Rate	7.1%
Cancellation Rate	5.1%
Return Cost	■24,700,071
Campaign Spend	■125,996,704
Delivery Compensation	■497,970

3. Evidence-backed Insights

- Electronics is the scale driver: 79.3% of net revenue, but its observed margin is 2.5%.
- Grocery records ■-366,690 in profit, indicating a margin/assortment problem rather than a simple growth opportunity.
- West delivery delay rate is 93.7%, with ■394,116 of compensation recorded in that region.
- Late delivery is associated with ■2,676,012 of return cost across the return dataset.
- The highest historical weighted campaign ROI channel in the supplied campaign data is Organic at 276.3%.
- Medium churn risk represents 2,129 customers, creating a measurable reactivation pool.

4. ■10 Lakh Investment Plan

Initiative	Allocation	Scenario ROI	Expected Incremental Pro
Referral growth	■350,000	167.8%	■587,466
Email retention campaigns	■200,000	138.3%	■276,549
Google Ads efficiency scale	■100,000	54.7%	■54,712
West delivery reliability	■150,000	128.6%	■192,918
Medium-risk customer reactivation	■100,000	95.7%	■95,693

Grocery margin repair	■100,000	146.7%	■146,676
TOTAL	■1,000,000	135.4%	■1,354,015

5. Methodology & Assumptions

Channel initiatives use historical weighted profit/spend from the supplied campaign dataset. Operational initiatives use explicit scenario assumptions rather than pretending future impact is known: West delivery assumes 15% reduction in West compensation plus 5% reduction in late-delivery return cost; medium-risk reactivation assumes 12% of medium-risk customers produce one additional delivered order; Grocery margin repair assumes recovery of 40% of the observed Grocery loss. These assumptions should be stress-tested during presentation.

6. Risks & Controls

Key risks are non-linear campaign response, attribution bias, delivery improvements not translating into retention, customer response uncertainty, and the possibility that Grocery losses have structural cost drivers. Controls: use staged pilots, cap spend by channel, monitor incremental profit rather than revenue alone, compare pre/post cohorts, and stop or reallocate funds when observed ROI falls below the scenario threshold.

7. Final Recommendation

Use the ■10 lakh as a portfolio of measurable experiments rather than a single bet. The proposed plan puts the largest share into channels with demonstrated historical contribution, while reserving budget for the most visible operational leaks: West delivery, medium-risk customer reactivation and Grocery margin repair. The dashboard should be used as the monitoring layer and the allocation should be revisited as actual incremental results arrive.
